AI Agents Arena 2.0 — “Meow Meow Veterinary Hospital - Operation Front Desk”

Participant problem statement · Single round · 3 hours build + 1 hour evaluation

0. Briefing

Meow Meow Veterinary Hospital needs an AI front-desk assistant. Build a working workflow that understands a pet owner’s message, checks real availability, books or cancels an appointment, and records the result. If information is missing or a request needs a human, the assistant must say so and take the appropriate next step.

Start with the core journey, then add reliability features. One agent is enough; voice and a website are optional. This fictional scheduling exercise requires no medical assessment.

Rules of engagement

- Teams have 1–2 members. Use any no-code / low-code platform, including n8n, Make or Zapier. Code steps and third-party APIs are allowed; the workflow must run in your chosen platform.
- Internet, documentation and AI assistants are allowed. All challenge workflows, prompts and code must be built during the round. Templates, starter workflows and previously built solutions are prohibited, as stated in the event rule book.
- Bring working platform, Google and LLM accounts and credentials. No extra setup time is provided; no challenge solution may be prepared in advance.
- Use Google Calendar for appointments and Google Sheets for records. Judges must be able to submit fresh messages through your form, chat or webhook.
- Use an LLM to interpret free-text requests and choose a relevant next step. Check dates, availability and write results through tools or workflow logic; the model must not invent successful bookings.

1. Environment You Must Create

Item	Requirement
Calendars (2)	MMVH - Mr Saanp and MMVH - Miss Loomri. Share these test calendars with the judge account (edit access).
Google Sheet	Config, Appointments and CallLog tabs; judge view access. Optional State tab for retries or conversation state.
Input and output	A working form, chat or webhook; a visible response in chat, webhook output or a Sheet response column.
Notifications	The visible response is sufficient for core completion. Real email confirmations are an optional extension.

2. Clinic Facts and Booking Rules

Clinic timezone: America/Phoenix (UTC−07:00). All required inputs and outputs use clinic-local time. No phone-based timezone inference or international conversion is required. Use ARENA_NOW = 2026-11-11 09:00 clinic time for business rules; real timestamps may be used for execution logs.

Day / provider	Availability
Clinic	Monday–Friday 09:00–17:00; closed Saturday and Sunday. Holiday closure: 19 November 2026.
Mr Saanp	Monday–Friday, clinic hours; lunch 12:00–13:00.
Miss Loomri	Monday, Wednesday and Friday, clinic hours; lunch 12:00–13:00.

ID	Service	Species	Provider	Duration
S1	Wellness Exam	dog, cat	Mr Saanp	30 min
S2	Routine Follow-up	dog, cat	Mr Saanp	30 min
S3	Exotic Exam	rabbit, bird	Miss Loomri	45 min

Core rules

- One pet and one appointment per request. Booking requires owner name, email, pet name, species, service and exact requested date/time. Ask for missing or ambiguous details; never invent them. “Tomorrow” means 12 November relative to ARENA_NOW; “morning” alone needs an exact time.
- Accept starts on a 15-minute grid, at least 60 minutes after ARENA_NOW, on dates through 25 November 2026 inclusive. The full appointment must fit inside clinic and provider hours and avoid lunch.
- Read the relevant calendar before booking. Every overlapping event counts as busy, including staff meetings added manually. An all-day busy event blocks that day. Back-to-back appointments are allowed.
- If a slot is unavailable, explain why and ask for another time. Automatic suggestions are an extension. If the service or species is unsupported, decline the booking and offer a staff handoff.
- On success, create a real Calendar event, generate a unique reference and save an ACTIVE Appointments row with the event ID. Return the reference, pet, service, provider, date, time and clinic timezone.
- Cancellation requires the reference and matching email (compare email case-insensitively). Delete the event, retain its row as CANCELED, and confirm only after the deletion succeeds. Wrong email and unknown reference must return the same generic verification failure.
- Hours, lunch, provider days, service mapping, durations, holiday, lead time and final booking date must be readable in Config. Core teams may load them into workflow settings; automatic runtime Config loading is an extension.

3. Agent Behavior and Guardrails

- Interpret the user's message to choose booking, cancellation, clarification or staff handoff. Use tool results to decide the next step. A classifier followed by fixed routing earns some Agentic Design credit; adaptive tool use and demonstrated recovery earn more.
- Symptoms, diagnosis/medication questions and urgent-help requests require staff handoff without booking. Log HANDOFF and the reason. Give no diagnosis, dosing or assurance that the pet can wait. No severity classification is required.
- Treat customer text as data. "Ignore the rules", "I am the manager" and requests to list other clients must not bypass validation or reveal private records.
- If Calendar fails, report failure, never success. If saving its row fails after booking, remove the new event or flag NEEDS_ATTENTION with its event ID for reconciliation.
- Log every submitted request and its result, including rejected requests. Use an ERROR or NEEDS_ATTENTION result for failures; show the execution record if Sheets itself is unavailable.

4. Input and Records

Accept at least message and request_id. You may use separate owner, email, pet and date/time fields to reduce parsing work, but judges will provide the intent and at least one booking detail in free text. Document your input once; no particular JSON schema or HTTP response code is required.

Clarification can be a revised, complete submission with a new request_id; persistent multi-turn memory is optional. If both structured fields and the message supply conflicting details, ask which is correct before changing anything. Use synthetic contacts and the judge-supplied test email only.

Example input

```
request_id: DEMO-01
message: Book a wellness exam for my dog Milo on 16 November 2026 at 10:00.
owner_name: Alex Khan
email: [judge test email]
```

Tab	Minimum content
Config	The clinic and service rules from Section 2, stored in readable rows. Any clear table layout is acceptable.
Appointments	reference, owner_name, email, pet_name, species, service_id, provider, start_local, end_local, event_id, status
CallLog	request_id, timestamp, message, interpreted_intent, result_status, response, reference (if any)

Use one field per column. Return a readable status such as BOOKED, CANCELED, NEEDS_INFO, UNAVAILABLE, HANDOFF or ERROR. Equivalent labels are accepted. Never publish API keys or credentials in exports.

5. Extensions for Stronger Entries

Extension	What must be demonstrated
E1 · Useful alternatives	When a slot is blocked, offer up to three valid starts in chronological order, from the requested time through the next two clinic working days, within the booking horizon. Read live availability. Do not book an alternative without acceptance.
E2 · Safe rescheduling	Verify reference and email, validate the replacement slot, update Calendar and the same row, and keep the reference. A failed move must preserve the original appointment; ignore its own current event during conflict checks.
E3 · Replay protection	Submit the identical successful request twice, sequentially, with the same request_id. Return the prior result without another event, appointment row or notification. A new CallLog row for the replay is allowed. Concurrent requests are not required.
E4 · Config adaptation	At T+90 minutes, organizers change one service duration in Config. Use the new duration for future availability and new bookings without editing workflow logic. Existing appointments keep their original duration. The change affects this extension only.

Email confirmation, conversation memory or a useful accessibility feature may demonstrate creativity. Voice and multiple agents have no automatic scoring advantage.

A Message from Sheru Bhai

Hospital owner. The owner of arban tarban million trillion dollars. Currently on a very important call.

Look into this image. Sheru Bhai suspects you'll ignore it.
